## ABSTRACT

Phytochemical investigation of the roots of *Solanum melongena* L. resulted in the isolation of ten terpenes and sixteen lignans, including a new triterpene saponin, officinoterpenoside E (**1**) and twenty-five known compounds (**2-26**). All compounds were firstly isolated from *S. melongena* except **2**, **13**, **21**, **22**. The structures of these compounds were determined by 1D and 2D NMR spectra referring to the literatures, together with high-resolution mass spectrometric analysis. All compounds were evaluated for the cytotoxicity against three cancer cell lines (HepG2, Hela, and MCF-7) *in vitro*. The results showed that compounds **1**, **6**, **20**, **25** and **26** exhibited moderate cytotoxicity against HepG2, Hela and MCF-7 cells with IC<sub>50</sub> values in the range of 16.8±1.7 to 29.1±1.9 μM. Therefore, these terpenoids and lignans may have potential biological activity, and also seemed to be of great chemotaxonomic value for *S. melongena*.

**Keywords:** Solanaceae, *Solanum*, Natural product, Terpene, Lignan, Cytotoxicity
