

Supplementary Figure 3. . Histological changes in irradiated minipigs receiving control Lactated Ringer's (LR), local or intravenous (iv) injections of freshly isolated ADRCs. Skin biopsies collected from animals receiving LR or ADRCs (local or iv) were stained with H&E. Representative photomicrographs of sections stained with H&E at day 7, 14, 21 and 28 post-injury are shown. Arrows show areas of wound epithelialization. n=4-6/group.
