Abstract: Two compounds (9 and 10) having a camptothecin (CPT) analog conjugated to the  $4\beta$ -azido-4-deoxypodophyllotixin analog by untilizing the copper-catalyzed azide-alkyne cycloadditon (CuAAC) reaction, and were evaluated for their cytotoxicity against a panel of five human cancer cell lines (HL-60, SMMC-7721, A-549. MCF-7 and SW480) using the MTT (3-(4,5-dimethyl-thiahiazo-2-yl)-2,5-diphenyltetrazolium bromide) assay. Two novel conjugates shown weak cytotoxicity, compound 10 showed highly potent against HL-60 cell line tested, with IC<sub>50</sub> value 17.69±0.19 µM. This compound suggested its potential as anticancer agents for further development.

#### 1. Experimental

#### 1.1. General information

Melting points were measured by an X-4 melting point apparatus and were uncorrected. MS data were obtained in the ESI mode on API Qstar Pulsar instrument; HRMS data were obtained in the ESI mode on LCMS-IT-TOF (Shimadzu, Kyoto, Japan); NMR spectra were acquired on Bruker AV-400 (Bruker BioSpin GmbH, Rheinstetten, Germany) instruments, using tetramethylsilane (TMS) as an internal standard: chemical shifts ( $\delta$ ) are given in ppm, coupling constants (*J*) in Hz, the solvent signals were used as references (CDCl<sub>3</sub>:  $\delta_{\rm C} = 77.2$  ppm; residual CHCl<sub>3</sub> in CDCl<sub>3</sub>:  $\delta_{\rm H} = 7.26$  ppm; CD<sub>3</sub>OD:  $\delta_{\rm C} = 49.0$  ppm; residual CH<sub>3</sub>OH in CD<sub>3</sub>OD:  $\delta_{\rm H} =$ 4.78 ppm). Column chromatography (CC): silica gel (200 – 300 mesh; Qingdao Makall Group CO., LTD; Qingdao; China). All reaction was monitored using thin-layer chromatography (TLC) on silica gel plates.

#### 1.2. General procedure for the synthesis of $4\beta$ -azido-podophyllotoxins 7 and 8

To a solution of podophyllotoxin **1** (5 mmol) in dry dichloromethane ( $CH_2Cl_2$ , 50 mL), sodium iodide (NaI, 15 mmol) was added and stirred for 5 min. To this stirred suspension MeSO<sub>3</sub>H (15 mmol) was added dropwise with syringe at 0 °C and the stirring was continued for another 5 h at room temperature. Nitrogen was bubbled through the solution to drive off the excess hydrogen iodide. This solution was then evaporated *in vacuo* and used for the next reaction without further purification. To the above crude product a mixture of H<sub>2</sub>O-acetone (50 mL, 1:1) and anhydrous barium carbonate (BaCO<sub>3</sub>, 10 mmol) were added successively. After 30 min at 40 °C, the resultant mixture was diluted with  $CH_2Cl_2$  (100 mL), then poured into 10% Sodium thiosulfate (NaS<sub>2</sub>O<sub>4</sub>) solution (500 mL). The organic layer over sodium sulfate

(Na<sub>2</sub>SO<sub>4</sub>) and the solvent removed *in vacuo*. The residue was dried *in vacuo* (Kanal et al. 2003; Hansen et al. 1993). To a solution of residue (1.0 mmol) and sodium azide (5.0 mmol)) in trichloromethane (4 mL) was added trifluoroacetic acid (TFA, 13.2 mmol) dropwise. The reaction mixture was stirred for 1 h, but in order to avoid gel formation during the reaction it was necessary to add further TFA (52.8 mmol). The solution was neutralized with aqueous saturated sodium bicarbonate (NaHCO<sub>3</sub>). The phases were separated. The aqueous phase was extracted twice with CHCl<sub>3</sub> (20 mL). The combined organic phases were washed with water and dried over Na<sub>2</sub>SO<sub>4</sub>. Then the solvent was evaporation and the reaction mixture was chromatographed on silica gel to afford the product (Kuhn et al. 1969; Hansen et al. 1993).
